

Hydraulic Thruster Brake

Thruster brake is a device to retard the speed and to hold the moving machinery when it is stationary. The braking force to the shoes is applied by the spring by means of lever/rod mechanism. The shoes are moved clear off the drum again through lever / arm linkage mechanism by thruster which overcomes spring force.

Application :

Hydraulic Thruster Brake is robust and dependable possessing the stamina needed for the toughest duty conditions imposed by unattended drives in any industry because of its extra-ordinary versatility it has wide application in electrically driven Hoists, Cranes Elevators, Ropeways, Flap Valves Guillotine Machines, Conveyors, Steel Mills, etc.
